# Case Study: ICH patient that was not triaged

**EMERGENCY | MALE | AGE 70**

CLINICAL INDICATION: Fell down 5 steps

## **FINDINGS AS DETAILED IN REPORT:**

1. Brain: No evidence of acute intracranial abnormality. Chronic ischemic changes including infarcts, some of which are new
2. No evidence for acute cervical spine fracture or traumatic subluxation.

## **MISSED DETECTION IMPLICATIONS**

Small left temporal subdural hemorrhage was initially missed.

# Implication

**EMERGENCY | MALE | AGE 70**

CLINICAL INDICATION: Fell down 5 steps

## **FINDINGS AS DETAILED IN REPORT:**

1. Brain : No evidence of acute intracranial abnormality. Chronic ischemic changes including infarcts, some of which are new
2. No evidence for acute cervical spine fracture or traumatic subluxation.

## **MISSED DETECTION IMPLICATIONS**

Patient came back 6 days later. Interval report noted: Large 12 mm left subdural hematoma extending along the entire left cerebral convexity, with left-to-right midline shift of up to 9 mm.

# Implication Cont.

**EMERGENCY | MALE | AGE 70**

CLINICAL INDICATION: Fell down 5 steps

## **FINDINGS AS DETAILED IN REPORT:**

1. Brain : No evidence of acute intracranial abnormality. Chronic ischemic changes including infarcts, some of which are new
2. No evidence for acute cervical spine fracture or traumatic subluxation.

## **MISSED DETECTION IMPLICATIONS**

Patient was emergently taken for decompressive craniotomy with no change in neurological deficits and lethargy after the procedure.

# Prioritizing Urgent Cases

Expedite care for outpatients with acute pathologies  
Preventing patients with acute findings from leaving the facility
